

Permanent Injectables

Aquamid is a non re-absorbable, long-lasting product for facial correction. It does not become hard once injected and does not migrate from the point of injection. Scientific research has shown that the gel will stay in its place unchanged for at least 10 years and there is no reason to expect any changes after this period. The cosmetic result is very satisfying for the client and the procedure does not have to be repeated once the desired result is achieved. In 80% of cases this is usually after one or two procedures. Progressive ageing of the skin does continue and if required, extra Aquamid can be injected as necessary over time. The results obtained with Aquamid are immediate since the gel is homogenous and does not contain any microparticles. Aquamid is a soft tissue implant and the effect is clearly linked to the volume injected.

Aquamid is injected under the skin as a soft filling with a fine needle. Together with the injector you can decide what the final cosmetic result should be. It is performed with hardly any discomfort and no down time. After the injection you can go home or back to work immediately.

Aquamid can be used to treat:

- Wrinkle treatment, for example glabella frowns, nasolabial folds, depressed corners of the mouth
- Lip augmentation
- Correction of acne scars Augmentation of chin, forehead or cheekbones
- Augmentation of depressed cheeks
- Other facial corrections
